Problem 10.2.3.

Show that the form under the integral sign is exact in the plane and evaluate the integral. Show the details of your work.

$$\int_{(\pi/2,\pi)}^{(\pi,0)} \left(\frac{1}{2}\cos\frac{1}{2}x\cos 2y\ dx - 2\sin\frac{1}{2}x\sin 2y\ dy\right)$$

Solution.

The form is exact iff $\nabla\times\mathbf{F} = \mathbf{0}$, where $\mathbf{F} = \left[\frac{1}{2}\cos\frac{1}{2}x\cos 2y, -2\sin\frac{1}{2}x\sin 2y\right]$. For 2D $\mathbf{F}$,

$$\begin{aligned}\nabla\times\mathbf{F} &= (F_2)_x - (F_1)_y \\ &= \left(-\cos\frac{1}{2}x\sin 2y\right) - \left(-\cos\frac{1}{2}x\sin 2y\right) \\ &= 0\end{aligned}$$

Therefore the form is **exact**. The integral takes the form,

$$\int_A^B \mathbf{F}\cdot d\mathbf{r} = \int_A^B df = f(B) - f(A)$$

Finding f, such that $\nabla f = \mathbf{F}$,

$$f = \int F_1 dx = \int \frac{1}{2}\cos\frac{1}{2}x\cos 2y\ dx = \sin\frac{1}{2}x\cos 2y + g(x)$$

$$f_y = -2\sin\frac{1}{2}x\sin 2y + g_y = F_2 = -2\sin\frac{1}{2}x\sin 2y \implies g_y = 0 \implies g = 0$$

$$f = \sin\frac{1}{2}x\cos 2y$$

The integral is then,

$$\begin{aligned}\int_{(\pi/2,\pi)}^{(\pi,0)} df &= f(\pi,0) - f(\pi/2,\pi) \\ &= \boxed{1 - \frac{\sqrt{2}}{2}}\end{aligned}$$

Problem 10.2.5.

Show that the form under the integral sign is exact in space and evaluate the integral. Show the details of your work.

$$\int_{(0,0,\pi)}^{(2,1/2,\pi/2)} e^{xy}(y\sin z\ dx + x\sin z\ dy + \cos z\ dz)$$

Solution.

The form is exact iff $\nabla\times\mathbf{F}=\mathbf{0}$, where $\mathbf{F}=e^{xy}\,[y\sin z, x\sin z, \cos z]$.

$$\begin{aligned}\nabla\times\mathbf{F} &= \begin{vmatrix}\mathbf{i} & \mathbf{j} & \mathbf{k}\\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z}\\ F_1 & F_2 & F_3\end{vmatrix}\\ &= \begin{bmatrix}(F_3)_y-(F_2)_z\\ (F_1)_z-(F_3)_x\\ (F_2)_x-(F_1)_y\end{bmatrix} = \begin{bmatrix}(xe^{xy}\cos z)-(xe^{xy}\cos z)\\ (ye^{xy}\cos z)-(ye^{xy}\cos z)\\ (xye^{xy}\sin z+e^{xy}\sin z)-(xye^{xy}\sin z+e^{xy}\sin z)\end{bmatrix}=\mathbf{0}\end{aligned}$$

Therefore the form is **exact**. The integral takes the form,

$$\int_A^B \mathbf{F}\cdot d\mathbf{r}=\int_A^B df = f(B)-f(A)$$

Finding f, such that $\nabla f=\mathbf{F}$,

$$f=\int F_1 dx=\int e^{xy}y\sin z\ dx = e^{xy}\sin z + g(y,z)$$

$$f_y = xe^{xy}\sin z + g_y = F_2 = xe^{xy}\sin z \implies g_y=0 \implies g=h(z)$$

$$f_z = e^{xy}\cos z + h'(z) = F_3 = e^{xy}\cos z \implies h'(z)=0 \implies h(z)=0$$

$$f=e^{xy}\sin z$$

The integral is then,

$$\begin{aligned}\int_{(0,0,\pi)}^{(2,1/2,\pi/2)} df &= f(2,1/2,\pi/2)-f(0,0,\pi)\\ &= e\sin(\pi/2)-e^0\sin(\pi)\\ &= \boxed{e}\end{aligned}$$

Problem 10.2.13.

Check, and if independent, integrate from $(0,0,0)$ to (a,b,c).

$$2e^{x^2}(x\cos 2y\ dx - \sin 2y\ dy)$$

Solution.

The integral is independent iff $\nabla\times\mathbf{F}=\mathbf{0}$, where $\mathbf{F}=2e^{x^2}\,[x\cos 2y, -\sin 2y]$. For 2D $\mathbf{F}$,

$$\begin{aligned}\nabla\times\mathbf{F} &= (F_2)_x-(F_1)_y\\ &= \left(-4xe^{x^2}\sin 2y\right)-\left(-4xe^{x^2}\sin 2y\right)\\ &= 0\end{aligned}$$

Therefore the integral is **independent of path**. The integral takes the form,

$$\int_A^B \mathbf{F} \cdot d\mathbf{r} = \int_A^B df = f(B) - f(A)$$

Finding f, such that $\nabla f = \mathbf{F}$,

$$f = \int F_1 dx = \int 2e^{x^2} x \cos 2y \; dx = e^{x^2} \cos 2y + g(y)$$

$$f_y = -2e^{x^2} \sin 2y + g_y = F_2 = -2e^{x^2} \sin 2y \implies g_y = 0 \implies g(y) = 0$$

$$f = e^{x^2} \cos 2y$$

The integral is then,

$$\begin{aligned} \int_{(0,0,0)}^{(a,b,c)} df &= f(a,b,c) - f(0,0,0) \\ &= e^{a^2} \cos 2b - e^0 \cos 0 \\ &= \boxed{e^{a^2} \cos 2b - 1} \end{aligned}$$

Problem 10.2.16.

Check, and if independent, integrate from $(0,0,0)$ to (a,b,c).

$$e^y \; dx + (xe^y - e^z) \; dy - ye^z \; dz$$

Solution.

The integral is independent iff $\nabla \times \mathbf{F} = \mathbf{0}$, where $\mathbf{F} = [e^y, (xe^y - e^z), -ye^z]$.

$$\begin{aligned} \nabla \times \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ e^y & (xe^y - e^z) & -ye^z \end{vmatrix} \\ &= \left[\left(\frac{\partial}{\partial y}(-ye^z) - \frac{\partial}{\partial z}(xe^y - e^z) \right), \left(\frac{\partial}{\partial z}(e^y) - \frac{\partial}{\partial x}(-ye^z) \right), \left(\frac{\partial}{\partial x}(xe^y - e^z) - \frac{\partial}{\partial y}(e^y) \right) \right] \\ &= \left[\left((-e^z) - (-e^y) \right), (0 - 0), (e^y - e^y) \right] \\ &= \mathbf{0} \end{aligned}$$

Therefore the integral is **independent of path**. The integral takes the form,

$$\int_A^B \mathbf{F} \cdot d\mathbf{r} = \int_A^B df = f(B) - f(A)$$

Finding f, such that $\nabla f = \mathbf{F}$,

$$f = \int F_2 dy = \int (xe^y - e^z) dy = xe^y - ye^z + g(x,z)$$

$$f_x = e^y + g_x = F_1 = e^y \implies g_x = 0 \implies g(x,z) = h(z)$$

$$f_z = -ye^z + h_z = F_3 = -ye^z \implies h_z = 0 \implies h(z) = 0$$

$$f = xe^y - ye^z$$

The integral is then,

$$\begin{aligned}\int_{(0,0,0)}^{(a,b,c)} df &= f(a,b,c) - f(0,0,0) \\ &= (ae^b - be^c) - (0 - 0) \\ &= ae^b - be^c\end{aligned}$$

Problem 10.3.5.

Describe the region of integration and evaluate.

$$\int_0^1 \int_{x^2}^{x} (1 - 2xy)\ dy\ dx$$

Solution.

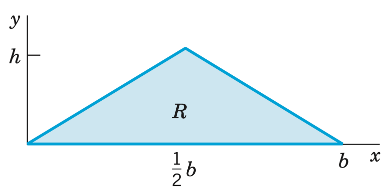
Problem 10.3.10.

Find the volume of the first octant region bounded by the coordinate planes and the surfaces $y = 1 - x^2$ and $z = 1 - x^2$. Sketch it.

Solution.

Problem 10.3.12.

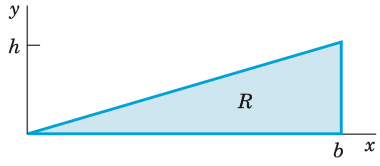
Find the center of gravity $(\bar{x}, \bar{y})$ of a mass of density $f(x,y) = 1$ in the given region R.



Solution.

Problem 10.3.17.

Find I_x, I_y, I_0 of a mass of density $f(x,y) = 1$ in the region R.



Solution.
